HAS SHE OR HASN'T SHE?

SANDRA BULLOCK

It's a little hard to believe Sandra Bullock is 46 years old. The recent Oscar winner, who garners attention for being one of the world's top earning actresses and a new mom, has managed to preserve a natural, youthful look despite a messy public divorce. We asked top medical professionals, who've never worked with Bullock, to clue us in on her age-defying secrets.

DR. DIMITRIOS MOTAKIS, MD, FRCSC, FACS, Plastic and Reconstructive Surgeon: "Sandra Bullock has practically stayed unchanged over the past 15 years. Although she's wearing makeup, there's no evidence of sun damage.

Facials, gentle chemical peels or microdermabrasion have likely helped her maintain flawless skin. The lack of wrinkles around her eyes, between her brows and forehead, as well as the position and shape of her brows, are consistent with the use of Botox.

Small amounts of hyaluronic acid fillers have probably been used to camouflage some early signs of aging. Her lips, thankfully, appear unchanged. Overall, any treatments have been subtle, giving her an attractive and natural appearance."

DR. NINO KUZMAR, MD, Medical Director, St. Clair Cosmetic & Laser Clinic "Here's a beautiful and intelligent woman who gets it! Good skin care coupled with subtle mainly non-invasive enhancement has maintained her exceptional beauty.

A definite but not too obvious use of Botox has kept frown lines, forehead

lines and crow's feet in check.

Excellent dermal filler work has maintained her midface and cheeks, reducing the nasolabial folds and minimizing volume loss in her lateral lower face, especially along the naturally occurring deep folds seen in Sandra with even minimal smiling."

DR. JON PERLUS, DDS, Periodontist, MRCDC: "It's evident that Sandra had some changes to her face, which affects the lip position in her smile creating the illusion that her smile line has changed and that her teeth have a different shape than before.

This would indicate periodontal plastic surgery to create a different gum line and/or crowns and veneers to re-contour her teeth while at the same time eliminating any defects or dental fillings and making them more consistent in colour. ☺
